The invention relates to antibodies, especially humanised antibodies (see AAW83031-37), recognising the Fas antigen. Such antibodies preferably comprise a heavy chain and a light chain including CDRs (see AAW8304-29) from the heavy and light chains of HFE7A. Humanised antibodies are produced by CDR grafting. The antibodies are capable of inducing apoptosis in abnormal cells expressing Fas, and of

3B9 was positive. cDNA clones of the 3B9 light and heavy chains were cloned into pGEM7f+ and transformed into E. coli DH5-alpha. A light chai cDNA clone was sequenced (AAQ83490) that encoded the protein given in AARY0189. 3 CDRS (AARX0185-97) were identified. (Updated on 25-MAR-2003 to correct PN field.)

               evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimotone disease, graft versus host disease, Sjogren syndrome, pernicious anemia, Addison's disease, soleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocalentis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed). (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New DNA molecules encoding recombinant antibodies useful for treating IL4 -mediated conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Light chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic aesthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a complementarity determining region (CDR) of the light chain variable region of murine interleukin-4 (IL-4) antibody 389. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock,
                                                                                                                                                                                                                                                                                                                   Gaps
 inhibiting Fas-induced apoptosis in normal cells. They are used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (CDR) from an artibody of the invention. The antibody is a chimeric or humanised interleukin-4 (II4) monoclonal antibody for the treatment of immunoglobulin B (IBB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic defrantitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft
              are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, alimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived complementarity determining region CDR-2 protein fragment which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRS (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, applastic anaemia (pammyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AABI4744-B14746 represent CDRs 1-3 of the light chain of the murine anti-human Fas monoclonal antibody HFE7A, which is produced by hybridoma HFE7A (FERM-BP-5828)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody.
                                                                                                                                                                                                                                                                                                                                                       Anti-Fas antibody, monoclonal antibody HFE7A, FERM-BP-5828, murine, complementarity determining region, CDR, human Fas, Fas ligand, apoptosis modulator, programmed cell death, autoimmune disease, allergy, atteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia, panmyelophthisis, hepatitis, AIDS; graft rejection;

THE PROPERTY

```
The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. Sequences AAV$9259-61 represent the complementarity determining region (CDR)-1, 2 and CDR-3 fragments in the L chain variable region of the antibody respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; 1F7; antibody; immune modulator; anti-HIV antibody; CDR; complementarity determining region; framework-determining region; FR; heavy chain; light chain; HIV infection.

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

CC molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

CC molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

CC apoptosis in cells with a normal system, by inhibiting binding between

Fas and its ligand. The products of the invention have anti-inflammatory,

continuomodulatory, dermatological, immunosupressive, thyromimetic,

antirheumatic, nephrotropic, antiinfartility, neuroprotective,

continuomodulatory, dermatological, immunosupressive, thyrometric antively

contenses associated with the Pas/Fas ligand sytem, especially systemic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a preventive or treating agent for diseases caused by abnormality in the Fas/Fas ligand system containing, as the active component, an antibody having a light chain subunit and a heavy chain subunit and an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has antiallergic, immunosuppressive and apoptocit activity and is used for preventing and treating autoimmume diseases, allergy, atopy and others. The present sequence is that of a peptide useful to the invention
                                                                                   The present invention relates to coding sequences of the murine 1F7 anti-
idiotypic antibody complementarity-determining region (CDR) or framework-
determining region (FR). The antibody binds to human or primate anti-
human immunodeficiency virus (HIV) antibodies and can be used in the
treatment of HIV infection. The present sequence is a region of the 1F7
light chain
New polynucleotide encoding a complementarity- or framework-determining region of an anti-idiotypic antibody that binds to human or primate anti-human immunodeficiency virus (HIV) antibodies, for use in vaccines
                                                                                                                                                                                                                                 Gaps

The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides cenceding different immunoglobulin binding protein (IgBP) polypeptides that specifically bind to a ligand or form one or more disulphide bonds with polypeptides in transfected cells, to generate an IgBP that binds to a ligand, and transformed plant cells are selected, and preparing an IgBP aright polypeptides in transfers one peptide sequence has at least 75% acquence identity to a framework region (FR) of a native IgM, IgG, IgA, IgD, IgE, IgY, kappa or lambda immunoglobulin molecule. The method is useful for preparing an immunoglobulin binding protein array, preferably plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The CHBP is useful for the preparing an mammalian cells) and anying desired characterictics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparing immunoglobulin binding protein array in plant cells by transforming the cells with different polynucleotides encoding binding protein polypeptides specific to ligand, selecting plant cells for preparing array.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     characteristics. The present sequence is a mammalian immunoglobulin derived peptide that may be incorporated into an IgBP of the invention

Novel antibody that immunospecifically binds to CD30, useful for treating Hodgkin's disease, exerts a cytostatic or cytotoxic effect on Hodgkin's Disease cell line, and is not monoclonal antibody AC10 or HeFi-1.
                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an antibody (I) that immunospecifically binds to CD30, exerts a cytostatic or cytotoxic effect on Hodgkin's Disease cell line, and is not monoclonal antibody Ac10 or Heři-1 and does not result from cleavage of AC10 or Heři-1 with papain or pepsin. (I), a protein (II) that competes for CD30 binding with the monoclonal antibodies AC10 or Heři, or exerts a cytotoxic or cytostatic effect on a Hodgkins' disease cell line and the nucleic acid encoding the protein (III) are useful for the treatment or prevention of Hodgkin's Disease in a subject, by administering (I) to the subject, in the absence of conjugation to acytostatic or cytotoxic agent, respectively and a pharmaceutically acceptable carrier. This is the amino acid sequence of the mouse AC10 antibody light chain complementarity determining region 2 (CDR2), a polypeptide that completes with AC10 for CD30 binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse; chemokine; scFV; CD4 antibody; human immunodeficiency virus; HIV; RANTES; pharmaceutical; infection; acquired immune deficiency syndrome; AIDS; inflammatory; autoimmune disease; gene therapy; immunosuppressive;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, all fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis in a cell expressing Fas. The agent has immunosuppressive and antiallargic activity and is used for preventing and treating autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drug containing humanized anti-Pas antibody, used for preventing and treating autoimmune diseases, allergy, and atopy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           allergy, atopy and others. The present sequence is that of a peptide useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gapa

                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                        The present invention relates to a chemokine construct comprising scFV and a RAWTES chemokine or their fragments. Sequences of the invention are useful for preparing a pharmaceutical composition for treating human immunodeficiency virus (HIV)-infection or acquired immune deficiency syndrome (ADS) or inflammatory and/or autoimmune diseases. They are used as vaccines and in gene therapy. The present sequence is mouse anti-CD4 VL CDR2 protein
                                                                                                                                                                                                                                                                                                                                                                                                                            Immunological disorder; CD30; cytostatic; lymphocyte related disorder; cytocoxic; atopic dermatitis; systemic lupus erythematosus; psoriasis; atopic asthma; rhinoconjunctivitis; allergic rhinitis; Grave's disease; Omenn's syndrome; tuberculosis; Sjogren's syndrome; multiple sclerosis; graft-versus-host disease; primary biliary cirrhosis; viral infection; rheumatoid arthritis; Hashimoco's thyroiditis; Wegener's granulomatosis; human immunodeficiency virus; HIV; therapy; antibody; mouse; CDR;
                      New chemokine construct comprising scFV anti-CD4 and a RANTES chemokine,

comprising an antibody that immunospecifically binds CD30 and exerts a cytostatic or cytotoxic effect on an activated lymphocyte and a carrier. The method is useful for treating Th_2-1/pmphocyte related disorders such as atopic dermatitis, systemic lugus erythematosus, atopic asthma. Corresponding erythematosus, atopic asthma. Corresponding erythematosus. The method is also useful colerosis or chronic graft-versus-host disease. The method is also useful for treating Th_1-1/pmphocyte-related immunological disorders such as rheumatoid arthritis, multiple sclerosis, psoriasis, Sjogren's syndrome, Hashimoto's thyroiditis, Grave's disease, primary biliary cirrhosis, Wegener's granulomatosis, tuberculosis or acute graft-versus host disease or for treating an immunological disorder due to viral infection that involves Epstein-Barr virus, human immunodeficiency virus (HIV), human T leukaemia virus, hepatitis B virus or measles virus or for treating an activated B lymphocyte-related disorder. The present sequence is mouse anti-CD30 antibody (AC10) light chain complementarity determining region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antibodies that immunospecifically bind CD30 and exert a cytostatic or cytotoxic effect on a Hodgkin's disease cell line, useful for treating, inhibiting or preventing Hodgkin's Disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

a surface of a proteinaceous material representing a binding surface (epitope) that associates with a predetermined binding surface (epitope) that associates with a predetermined binding surface (epitope) that associates with a predetermined binding molecule. The method comprises screening a peptide library with a predetermined binding molecule, mapping on a three-dimensional model of the proteinaceous material the pairs of amino acids represented by tandem pairs of symbols, and determining clusters of amino acid pairs. Also described are: (i) a method of identifying a basic element of a binding surface on a method of identifying a basic element of a binding surface on a molecule, (ii) a method of producing a binding surface mimetic, (iii) a pharmaceutical composition including one or more of the basic elements of the binding surface of gpl20 that is recognized by a broadly neutralizing antibody, comprising a carrier and one or more of the peptides consisting of a mino acids 360-362, 391-396, 464-468 or 110-118 of the fully defined sequence given as SEQ ID NO:1 in the specification, and (iv) a molecule mimetic of the binding surface of gpl20 that is recognized by a broadly neutralizing antibody, obtained by connecting peptides $360-362, 391-396 and 464-468 of SEQ ID NO:1, each in forward or reverse sequence, in such a manner as to form a single molecule that maintains the spatial
                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for improved prediction of a region on a surface of proteinaceous material representing a binding surface that associates with a predetermined binding molecule by screening a peptide library with
                   CD30 and exert a cytostatic or cytotoxic effect on a Hodgkin's disease. The invention is useful for treating, inhibiting or preventing Hodgkin's disease. The invention is also useful in gene therapy. The present sequence is mouse AC10 CD30 antibody light chain-complementarity
invention relates to antibodies that immunospecifically bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to a method for improved prediction of a region on

             362, 391-396 and 464-468 of gpl20. The method is useful for improved prediction of a region on a surface of proteinaceous material representing a binding surface that associates with a predetermined binding molecule. This sequence represents a complementarity determining region (CDR) of a monoclonal antibody (mAb) used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAR66140-R66146 are peptides complementary to the variable region of th CD-4 antibody, these peptides are fixed onto a claimed nonwoven fabric (average fibre dia. of 1-30 microns) coated with keto-alkyl halide functional groups. This material can be used as a filter for CD-4 positive cells in a medical treatment involving the extra-corporeal circulation of blood

This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a muxine derived protein fragment which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                   CD4 or CD34 and their use for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides an antibody having affinity to CD4 antigen. Th anti-human CD4 antibody 4H5 is used for the detection of antigen and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes the variable heavy and light chain regions (1) of murine monoclonal antibody (mAB) 1F7. AAY91014 to AAY91016 the represent specifically claimed amino acid sequences of the variable light ending, and AAY91017 to AAY91019 represent specifically claimed amino acid sequence of the variable heavy chain. The antibodies are used for treatment of HIV (human immunodeficiency virus) infection and AIDS (acquired immunodeficiency syndrome). They are also used for detecting HIV in serum and for stimulating HIV antigen related and committed B colls to produce broadly reactive and neutralising antibodies by

```
Antibodies capable of binding FCEL-bound IgE but which are substantially incapable of binding FCEH-bound IgE or inducing histamine release from mast cells or basophils, comprise a human Kabat CDR domain into which has been substituted a positionally analogous residue from a Kabat CDR domain of the murine anti-hungE antibodies MAEL1, MAEL3, MAELS or MAEL7.
                                                                                                                                                     Antibody; high affinity; FCEH; low affinity; FCEL; IgE receptor; histamine; mast cell; basophil; Kabat; CDR; murine; MAE11; MAE13; MAE15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunoglobulin B; 1gB; anti-human IgE; bispecific antibody; FCEL; FCEH; low affinity binding receptor; high affinity binding receptor; allergy; diagnosis; treatment; histamine release; prevent; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polypeptide(s) binding to specific Fc epsilon receptors - act as IgE antagonists; useful for treating and preventing IgE-mediated disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a chemokine construct comprising scFV anti-CD4 and a RANTES chemokine or their fragments. Sequences of the invention are useful for preparing a pharmaceutical composition for treating human immunodeficiency virus (HIV) inflection or acquired immune deficiency syndrome (AIDS) or inflammatory and/or autoimmune diseases. They are used as vaccines and in gene therapy. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chemokine construct comprising scFV anti-CD4 and a RANTES chemokine, useful for the preparing a composition for treating HIV-infection or inflammatory or autoimmune diseases.
                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
application for drugs. It is highly safe in human dose. The present sequence represents the L chain variable region of the antibody 4H5
                                                                                                                     ô

New polynucleotide encoding a complementarity- or framework-determining region of an anti-idiotypic antibody that binds to human or primate antihuman immunodeficiency virus (HIV) antibodies, for use in vaccines
                                                                                                                                                                                                                                         The present invention relates to coding sequences of the murine 1F7 anti-
idiotypic antibody complementarity-determining region (CDR) or framework-
determining region (FR). The antibody binds to human or primate anti-
human immunodeficiency virus (HIV) antibodies and can be used in the
treatment of HIV infection. The present sequence is the 1F7 light chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is an L chain variable region from an immunoglobulin with anti-HIV neutralising activity. See AAN9491-13, and AAN96495. (Updated c3-FAMR-2003 to correct PA field.) (Updated on 27-AUG-2003 to correct OS field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric anti-human immune virus antibodies - contg. mouse variable regions and human constant regions for diagnosis, treatment and prevention of AIDS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the light chain amino acid sequence of a mouse anti-human immunoglobulin B (IgB) antibody. The invention relates to a bispecific antibody that binds specifically to IgB when IgB is bound to its low affinity receptor (FCEH). but does not bind to IgB, when IgB is bound to its low affinity receptor (FCEH). The bispecific antibody comparises an IgB-binding arm with human framework residues of a recipient human antibody and donor murine CDR (complementarity determining region) residues, but with at least one human CDR residue replacing the analogous murine residue. The antibody also comprises an FV that is specific for a predetermined antigno other than IgB. The antibodies work by displacing bound IgB from its receptor, or via competitive inhibition of its binding. The bispecific antibodies are used for diagnosis, treatment and prevention of allergy and other IgB-mediated diseases, also, when the siolating of For the invention do not cause granulation or release of histamine from mast cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Murine monoclonal antibodies mu 39.1 and mu 5.5 both neutralise HIV. The heavy and light chain variable regions from these antibodies were sequenced (AARS5120-ES5123). The murine anti-HIV CDRs were introduced into human framework regions to construct chimeric antibodies (AARS5124-RS5127). (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mouse-human chimeric anti-HIV antibody heavy and light chains - and recombinant antibody consisting of the H- and L-chains, useful in AIDS

The heavy and light chain variable regions from these antibodies were sequenced (AAR55120-R55123). The murine amelial regions tronduced into human framework regions to construct chimeric antibodies (AAR55124-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse-human chimeric anti-HIV antibody heavy and light chains - and recombinant antibody consisting of the H- and L-chains, useful in AIDS

```

sequence."

```
The recombinant antibody light chain has neutralising activity against HIV. Chimeric antibodies comprising both mouse and human sequences are useful in the treatment/prevention of AIDS caused by HIV. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant chimeric anti HIV antibody - useful for the treatment and

Antibody, interleukin-4; IL4; immunoglobulin E; IgB mediated disease; allergic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cluster differentiation, cell separation, antibody, CD4, CD34, leukemia, hematopoietic, undifferentiated, lymphocyte, bone marrow transplantation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are alsuseful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the light chain of the humanised 3B9 antiboothe invention. The antibody is a chimeric or humanised interleukin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant IL4 antibodies useful for tratment of allergic rhinitis, atopic ashthma and anaphylactic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 111;

differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising CD4 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of lymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived protein fragment which is used to illustrate the method of the invention
                                                                                          Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.
                                                                                                                                                               This invention describes a novel device (I) for separating cluster
                                                                                                                                                                                                                                                                                                                                           100.0%; Score 31; DB 3; Length 111; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel device (I) for separating cluster differentiation (CD)-positive cells using a recombinant (chimeric or single-chain) antibody recognising or CD34 or CD34. The devices are useful for the separation of CD4 or CD34 positive cells, which is useful for the collection of hematopoietic undifferentiated cells, elimination of Inymphocytes from cells to be used in bone marrow transplantation, the detection of leukemic cells and the production of medicinal compositions for the treatment of HIV infection and autoimmune diseases. This sequence represents a murine derived protein fragment which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cluster differentiation, cell separation, antibody; CD4; CD34; leukemia; hematopoietic; undifferentiated; lymphocyte; bone marrow transplantation; HIV infection; autoimmune disease; murine.
                                                                                                                                                                                                                                                                                   Devices containing antibodies recognising CD4 or CD34 and their use for the separation of CD4 or CD34 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention provides an antibody having affinity to CD4 antigen. The anti-human CD4 antibody 4H5 is used for the detection of antigen and application for drugs. It is highly safe in human dose. The present sequence represents a L chain fragment of the antibody 4H5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 31; DB 3; Length 111;
An antibody and the nucleic acid coding the antibody.

The invention relates to a method of treating an immunological disorder in a subject where the immunological disorder is not cancer. The method involves administering to the subject a pharmaceutical composition comprising an antibody that immunospecifically binds CD30 and exerts a cytostatic or cytotoxic effect on an activated lymphocyte and a carrier. The method is useful for treating Th 2-lymphocyte related disorders such as atopic dermatitis, systemic lupus erythematosus, atopic asthma, rhinoconjunctivitis, allergic rhinitis, Omenn's syndrome, systemic sclerosis or chronic graft-versus-host disease. The method is also useful for treating Th 1-lymphocyte-related immunological disorders such as rheumatoid arthritis, multiple sclerosis, psoriasis, Sjogren's syndrome, Hashimoto's thyroiditis, Grave's disease, primary biliary cirrhosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wegener's granulomatosis, tuberculosis or acute graft-versus host disease
                                                                                                                                                              cytotoxic, atopic dermatitis, systemic lupus erythematosus; psoriasis; atopic asthma; rhinoconjunctivitis; allergic rhinitis; Grave's disease; Omenn's syndrome; tuberculosis; Sjogren's syndrome; multiple sclerosis; graft-versus-host disease; primary biliary cirrhosis; viral infection; rheumatoid arthritis; Hashimoto's thyroiditis; Wegener's granulomatosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating immunological disorder that is not cancer, in a subject, by administering composition comprising a first antibody that specifically binds CD30 and exerts a cytostatic or cytotoxic effect on activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or for treating an immunological disorder due to viral infection that involves Epstein-Barr virus, human immunodeficiency virus (HIV), human leukaemia virus (HIV), human activated B lymphocyte-related disorder. The present sequence is mouse anti-CD30 antibody (AC10) light chain variable region
                                                                                             Mouse anti-CD30 antibody (AC10) light chain variable region.
                                                                                                                                                                                                                                                                                 human immunodeficiency virus; HIV; therapy; antibody; mouse.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an antibody (I) that immunospecifically binds to CD30, exerts a cytostatic or cytotoxic effect on Hodgkin's Disease cell line, and is not monoclonal antibody ACIO or HeFt.1 and does not result from cleavage of ACIO or HeFt.1 with papain or pepsin. (I), a protein (II) that competes for CD30 binding with the monoclonal antibodies ACIO or HeFt, or exerts a cytotoxic or cytostatic effect on a Hodgkins' of sisease cell line and the nucleic acid encoding the protein (III) are useful for the treatment or prevention of Hodgkin's Disease in a subject, by administering (I) to the subject, in the absence of conjugation to a cytostatic or cytotoxic agent, respectively and a pharmaceutically acceptable carrier. This is the amino acid sequence of the mouse ACIO antibody light, chain variable region, a polypeptide that competes with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antibody that immunospecifically binds to CD30, useful for treatin Hodgkin's disease, exerts a cytostatic or cytotoxic effect on Hodgkin's Disease cell line, and is not monoclonal antibody AC10 or HePi-1.
                                                                                                                                                                                                                                                                                                                                                                                                             Gene therapy, vaccine, CD10 binding, cytostatic, cytotoxic,
Hodgkin's Disease, mouse, AC10 antibody, light chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an antibody (I) that competitively inhibits binding of TWEFF#19 to TWEFF2. Also described: (1) a pharmaceutical composition comprising the antibody and a carrier; (2) detecting a prostate cancer cell in a biological sample from a patient by contacting the biological sample with the antibody; (3) inhibiting proliferation of a prostate cancer-associated cell by contacting the cell with the antibody; only composition and (4) treating prostate cancer with an antibody to TWEFF2. (I) has cytostatic activity and can be used in vaccines. The antibody, composition and method are useful for treating prostate cancer, and method are useful for treating prostate cancer, e.g. primary prostate cancer, metastatic prostate cancer, locally advanced prostate cancer, androgen independent prostate cancer, prostate cancer that has been treated with neoadjuvant therapy, or prostate cancer that is refractory to treatment with neoadjuvant therapy. The present sequence is used in the exemplification of the present invention.
                                                                            antibody; TMEFF2#19; TMEFF2; binding inhibitor; prostate cancer; cytostatic; vaccine; primary prostate cancer; metastatic prostate cancer; locally advanced prostate cancer; androgen independent prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibody that competitively inhibits binding of TMEFF219 to TMEFF2, useful for treating prostate cancer, e.g. primary, metastatic, locally advanced, or androgen independent prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to antibodies that immunospecifically bind CD30 and exert a cytostatic or cytotoxic effect on a Hodgkin's disease. The invention is useful for treating, inhibiting or preventing Hodgkin's disease. The invention is also useful in gene therapy. The present sequence is mouse AC10 CD30 antibody light chain variable region protein.
New antibodies that immunospecifically bind CD30 and exert a cytostatic or cytotoxic effect on a Hodgkin's disease cell line, useful for treating, inhibiting or preventing Hodgkin's Disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     High mobility group box; HWGB1; monoclonal antibody; antibody therapy; sepsis; antibacterial immunosuppressive; graft rejection; arthritis; antibacterial immunosuppressive; graft rejection; arthritis; antiathmatic; lupus erythematosus; antiinflammatory; inflammation; dermatological; psoriasis; respiratory distress syndrome; respiratory-gen.; psoriasis; antipsoriatic; chronic obstructive pulmonary disease; pancreatitis; peritonitis; burns; vulnerary; ischemia; vasotropic; Behcets disease; graft versus host disease; inflammatory bowel disease; gastrointestinal-gen.; multiple sclerosis neuroprotective; cachexia; anabolic; infection; musculoskeletal disease; immune disorder.

Generating variant protein for host, by comparing parent protein sequence with natural protein sequences from host, analyzing and substituting amino acids of parent sequences with corresponding amino acid string of
                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method for generating a variant protein natural brotein sequence with natural protein sequence with natural protein sequence with corresponding amino acid strings of the parent sequence with corresponding amino acid strings of each of the natural protein sequences, and substituting amino acids of parent protein sequence with corresponding amino acid strings of a natural protein sequence on an amino acid string. The method is useful for generating a variant protein, e.g. a variant antibody for a host as compared to a parent protein. The method enables the generation of variant proteins having an increased host string content and reduced immunogenicity. This sequence represents a human variant antibody of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides antibodies, or their antigen-binding fragments, that bind to a vertebrate high mobility group box (HMGB) polypeptide, to methods of detecting and/or identifying an agent that binds to an HMGB polypeptide, methods of treating a condition in a subject characterized by activation of an inflammatory cytokine cascade, and methods of detecting an HMGB polypeptide in a sample. The antibody (or antigenbinding fragment) binds to a vertebrate HMGB A box but does not specifically bind to non-A box epitopes of HMGB, and inhibits release of a proinflammatory cytokine from a vertebrate cell treated with an HMGB protein. A method of treating a condition characterized by activation of an inflammatory cytokine cascade comprises administering an antibody of the invention, or its antigen-binding fragment. The condition is selected from sepsis, allograft rejection, arthritis, asthma, lupus, adult respiratory distress syndrome, chronic obstructive pulmonary disease, psoriasis, pancreatitis, peritonitis, burns, ischemia, Behcet's disease, graft versus host disease, inflammatory bowel disease, multiple sclerosis and cachexia, especially sepsis, allman HMGBI. APRS5012. An identical sequence is that of the A box of human HMGBI. APRS5012. An identical

                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                 sednence
                                                                                                                                                  for a host. The method involves comparing a parent protein sequence with natural protein sequences from a host, analyzing the amino acid strings of the parent sequences from a host, analyzing the amino acid strings of the natural protein sequence with corresponding amino acid strings of each of protein sequences with corresponding amino acid strings of parent protein sequences with corresponding amino acid strings of a natural protein sequence on an amino acid string. The method is useful for generating a variant protein, e.g. a variant antibody for a host as compared to a parent protein. The method enables the generation of variant proteins having an increased host string content and reduced immunogenicity. This sequence represents the variable light chain of a human antibody protein used in the invention.
                                                                                                                                       invention relates to a novel method for generating a variant protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Generating variant protein for host, by comparing parent protein sequenc with natural protein sequences from host, analyzing and substituting amino acids of parent sequences with corresponding amino acid string of

```

The invention relates to a novel method for generating a variant protein

```
ö
              natural protein sequences from a host, analyzing the amino acid strings of the parent sequence with corresponding amino acid strings of each of the natural protein sequences, and substituting amino acids of parent protein sequences with corresponding amino acid strings of a natural protein sequence on an amino acid string. The method is useful for generating a variant protein, e.g. a variant antibody for a host as compared to a parent protein. The method enables the generation of variant proteins having an increased host string content and reduced immunogenicity. This sequence represents a human germ line variable light chain protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Generating variant protein for host, by comparing parent protein sequence with natural protein sequences from host, analyzing and substituting amino acids of parent sequences with corresponding amino acid string of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for generating a variant protein natural protein sequence with natural protein sequence from a host, analyzing the amino acid strings of the parent sequences from a host, analyzing the amino acid strings of the parent sequence with corresponding amino acid strings of each of the natural protein sequences, and substituting amino acids of parent protein sequence with corresponding amino acid strings of a natural protein sequence on an amino acid string. The method is useful for generating a variant protein, e.g. a variant antibody for a host as compared to a parent protein. The method enables the generation of variant proteins having an increased host string content and reduced immunogenicity. This sequence represents the variable light chain of a
host. The method involves comparing a parent protein sequence with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for generating a variant protein for a host. The method involves comparing a parent protein sequence with natural protein sequences from a host, analyzing the amino acid strings of the parent sequence with corresponding amino acid strings of each of the natural protein sequences, and substituting amino acids of parent protein sequences with corresponding amino acid strings of a natural protein sequence on an amino acid string. The method is useful for generating a variant protein. The method enables the generation of variant protein. The method enables the generation of variant proteins having an increased host string content and reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Generating variant protein for host, by comparing parent protein sequenc with natural protein sequences from host, analyzing and substituting amino acids of parent sequences with corresponding amino acid string of

                                                                                                                                             The framework regions (FR) are derived from the human antibody REI. The CDRs are mouse monoclonal antibody 0.5beta derived sequences. The anti-HIV modified antibody can be used for the prophylaxis and treatment of AIDS. Specific examples of the H chain are given in AAR24556-58 and AAR24560-62. A specific example of the L chain is given in AAR24575

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to modified (e.g. deimmunised) antibodies are less immunogenic compared to the unmodified anti-PSNA antibodies are less immunogenic compared to the unmodified anti-PSNA antibodies. The modified antibodies comprise complementarity determining regions (CDRs) from a non-human antibody (e.g. murine antibody J591,J415, J531 or B99), and framework sequences that are less immunogenic in humans (e.g. less antigenic than the murine frameworks in which a murine CDR human PRNA, with high affinity and specificity. The anti-PSNA antibodies are useful for treating or preventing a prostatic or cancerous disorder, e.g. genitourinary inflammation, prostatitis, benign enlargement, prostatic cancer or testicular cancer, or solid tumours, soft tissue tumours or metastatic lesions, and its associated pain. The present sequence represents a variable region from a murine antibody

The present invention describes a method (M1) for ablating or killing an aberrant prostate specific membrane antigen (FSMA)-expressing cell (e.g. an appidermal and a dermal cell). M1 comprises contacting the cell, or a vascular endothelial cell proximate to the cell, with an antibody (or its antigen-binding fragment), which binds specifically to the extracellular domain of FSMA in an amount sufficient to ablate or kill the cell. The antibodies have antiposriatic, antiarthritic, dermatological, cytostatic, antiantlammetory and antiallergic activities, and can be used in vaccines. M1 is useful for treating a skin disorder, in a subject, by administering to the subject, an amount of an antibody which binds specifically to the extracellular domain of FSMA (the subject, by administering to the extracellular domain of FSMA (the subject, by specifically to the extracellular domain of FSMA (the subject, by ammal, preferably human and is having, or at risk of, a skin disorder). The skin disorder and a defermal or an epidermal disorder, and is selected from psoriasis (preferably chronic stationary psoriasis, psoriasis, und partials (Von Zumbusch), annular pustular generatised pustular psoriasis, pityriasis rosacea, carfoliative dermatitis, pityriasis rubra pilaris, pityriasis rosacea, parapsoriasis, pityriasis (Von Zumbusch), annular pustular cosacea, chthyosiform dermatitis, keratodermas, dermaticia arthritis, preferably psoriasis, and psoriasis, keratodermas, dermaticia and planis or preferably psoriasis. M1 is useful for treating a skin disorder such as an inflamment or proprise dermaticial disorder of the parternal planis or parison. M1 is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      preferably an epidermal precancerous or cancerous lesion. M1 is also useful to treat or prevent disorders involving aberrant activity of PSMA-expressing cell, e.g. kidney, liver or brain cell. ACC69816 to ACC69837 and ABR44613 to ABR44733 represent sequences used in the exemplification
Mouse, murine, antibody, skin disorder, binding agent, PSMA, cytostatic, prostate specific membrane antigen, antipsoriatic, antiathritic, dermatological, antiniflammatory, antiallergic, vaccine, dermal disorder, epidermal disorder, inflammatory disorder, epidermis, dermis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ablating/killing aberrant prostate specific membrane antigen-expressing cells for treating skin disorders, by contacting the cell with an antibody that binds to the extracellular domain of prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```

The invention relates to the use of an anti-prostate specific membrane antigen (anti-PSMA) antibody or antigen-binding fragment for treating prostate cancer, monitoring a patient receiving an anti-PSMA antibody to treat prostate cancer, or selecting a patient for treatment with an anti-PSMA antibody. Also included are a method of treating prostate cancer in a subject, a method of monitoring a patient receiving an anti-PSMA antibody to reat prostate cancer and a method of selecting a patient for treatment with an anti-PSMA antibody. Also disclosed are anti-PSMA antibody or antigen-binding fragment is a human antibody (or an antigen-binding fragment). The modified antibody is selected from CDR-grafted antibody, thumanized antibody, deimmunized antibody, or antigen binding fragments. The modified antibody or antigen-binding fragment has one or more CDRs (complementarity determining region) from a mouse monoclonal antibody selected from 1591, 415, 4533, or E99. The anti-DSMA antibody to treating prostate cancer, monitoring a patient receiving an anti-PSMA antibody to treat prostate cancer, monitoring a patient receiving an anti-PSMA antibody to treat prostate cancer. ö selecting a patient for treatment with an anti-PSMA antibody. The present sequence is a mouse kabat subgroup consensus sequence for a light or heavy chain variable region used to compare to a sequence from one of the mouse monoclonal antibodies listed above. Designing molecular mimetics to mimic a parent molecule activity, useful e.g. therapeutically and diagnostically, uses computational screening to identify active chemical groups by accessibility within the parent molecule.

Example 1; Fig 1; 85pp; English.

The present sequence was used in a method for designing a mimetic which exhibits an activity associated with a parent molecule. Such mimetics may be smaller than the parent molecule and correspondingly easier and cheaper to make, since the active region of the parent molecule is normally relatively small. The method is useful where the parent molecule is a binding domain or the hypervariable region of an antibody or other member of the immunoglobulin superfamily. It is useful when the parent molecule is an antibody and the mimetic a peptide, especially an antibody which binds CD4 and a peptide which binds CD4. The mimetics designed and produced are useful diagnostically to detect cells bearing CD4 on their surfaces or may be included in pharmaceuticals e.g. to treat conditions in which CD4 is implicated (e.g. HIV)
